General Relativity

$$S_{\mathrm{EH}} = \frac{1}{2\kappa} \int_M \mathrm{d}^D x \, \sqrt{|g|} g^{ab} R_{ca}{}^{c}{}_{b}$$

General Relativity

$$S_{\mathrm{EH}} = \frac{1}{2\kappa} \int_M \mathrm{d}^D x \, \sqrt{|g|} g^{ab} R_{ca}{}^{c}{}_{b}$$

- Non-polynomial → Hard to quantize.

General Relativity

$$S_{\text{EH}} = \frac{1}{2\kappa} \int_M \mathrm{d}^D x \, \sqrt{|g|} g^{ab} R_{ca}{}^{c}{}_{b}$$

- Non-polynomial $\rightarrow$ Hard to quantize.
- Dimensionful coupling $\rightarrow$ Not perturbatively renormalizable.

General Relativity

$$S_{\text{EH}} = \frac{1}{2\kappa}\int\limits_M \mathrm{d}^D x\, \sqrt{|g|} g^{ab} R_{ca}{}^{c}{}_{b}$$

- Non-polynomial $\rightarrow$ Hard to quantize.
- Dimensionful coupling $\rightarrow$ Not perturbatively renormalizable.
- Has diffeomorphism redundancies: $\phi_* \mathbf{g} \cong \mathbf{g}$.

General Relativity

$$S_{\text{EH}} = \frac{1}{2\kappa} \int\limits_M \mathrm{d}^D x \, \sqrt{|g|} g^{ab} R_{ca}{}^{c}{}_{b}$$

- Non-polynomial $\rightarrow$ Hard to quantize.
- Dimensionful coupling $\rightarrow$ Not perturbatively renormalizable.
- Has diffeomorphism redundancies: $\phi_* \mathbf{g} \cong \mathbf{g}$.

We know how to quantize a class of theories with redundancies:

Yang-Mills

$$S_{\mathrm{YM}} = \frac{1}{g^2}\int_M \mathrm{Tr}\left[\mathbf{F}\wedge\star\mathbf{F}\right], \quad \mathbf{F} = \mathbf{dA} + [\mathbf{A}\wedge\mathbf{A}]$$

- Polynomial.

Yang-Mills

$$S_{\mathrm{YM}} = \frac{1}{g^2} \int_M \mathrm{Tr}\,[\mathbf{F} \wedge \star\mathbf{F}], \quad \mathbf{F} = \mathbf{dA} + [\mathbf{A} \stackrel{\wedge}{,} \mathbf{A}]$$

- Polynomial.
- Dimensionless coupling → Renormalizable.

Yang-Mills

$$S_{\text{YM}} = \frac{1}{g^2} \int_M \text{Tr}\,[\mathbf{F} \wedge \star\mathbf{F}], \quad \mathbf{F} = \mathbf{dA} + [\mathbf{A} \wedge \mathbf{A}]$$

- Polynomial.
- Dimensionless coupling $\rightarrow$ Renormalizable.
- Has local Lie group-valued redundancies, $\mathbf{A} \cong U(\mathbf{A} + \mathbf{d})U^{-1}$.

Yang-Mills

$$S_{\mathrm{YM}} = \frac{1}{g^2}\int_M \mathrm{Tr}\left[\mathbf{F}\wedge\star\mathbf{F}\right], \quad \mathbf{F} = \mathbf{dA} + [\mathbf{A} \wedge \mathbf{A}]$$

- Polynomial.
- Dimensionless coupling $\rightarrow$ Renormalizable.
- Has local Lie group-valued redundancies, $\mathbf{A} \cong U(\mathbf{A}+\mathbf{d})U^{-1}$.

It's possible to formulate GR as YM theory?

Why $D = 2 + 1$?

- No local propagating modes:

$$\text{d.o.f.} = \frac{1}{2} D(D-3)$$

Simpler but non-trivial toy model.

Recover of polynomiality

- Change of variables: $\mathbf{g} \to \begin{cases} \mathbf{e}^{\mu}, & \text{Vielbein} \\ \boldsymbol{\omega}_{\alpha\beta}, & \text{Spin connection} \end{cases}$

Recover of polynomiality

- Change of variables: $\mathbf{g} \to \begin{cases} \mathbf{e}^{\mu}, & \text{Vielbein} \\ \boldsymbol{\omega}_{\alpha\beta}, & \text{Spin connection} \end{cases}$
- Relax torsionless condition $\to$ $\mathbf{e}^{\mu}$ and $\boldsymbol{\omega}_{\alpha\beta}$ are independent.

Recover of polynomiality

- Change of variables: $\mathbf{g} \to \begin{cases} \mathbf{e}^\mu, & \text{Vielbein} \\ \boldsymbol{\omega}_{\alpha\beta}, & \text{Spin connection} \end{cases}$
- Relax torsionless condition $\to$ $\mathbf{e}^\mu$ and $\boldsymbol{\omega}_{\alpha\beta}$ are independent.

$$S_{\mathrm{EH}} = \frac{1}{2\kappa}\int_M \star\mathbf{R}^{\alpha\beta}\wedge\mathbf{e}_\alpha\wedge\mathbf{e}_\beta \overset{D=3}{=} \frac{1}{2\kappa}\epsilon_{\alpha\beta\mu}\int_M \mathbf{R}^{\alpha\beta}\wedge\mathbf{e}^\mu$$

Recover of polynomiality

- Change of variables: $\mathbf{g} \to \begin{cases} \mathbf{e}^{\mu}, & \text{Vielbein} \\ \boldsymbol{\omega}_{\alpha\beta}, & \text{Spin connection} \end{cases}$
- Relax torsionless condition $\to$ $\mathbf{e}^{\mu}$ and $\boldsymbol{\omega}_{\alpha\beta}$ are independent.

$$S_{\mathrm{EH}} = \frac{1}{2\kappa}\int_M \star\mathbf{R}^{\alpha\beta} \wedge \mathbf{e}_{\alpha} \wedge \mathbf{e}_{\beta} \overset{D=3}{=} \frac{1}{2\kappa}\epsilon_{\alpha\beta\mu}\int_M \mathbf{R}^{\alpha\beta} \wedge \mathbf{e}^{\mu}$$

Can we write the integrand as a trace?

Recover of dimensionless coupling constant

- For $\mathfrak{iso}(2,1)$:

$$\mathrm{Tr}\left[J_{\alpha\beta}P_{\mu}\right] = \frac{\lambda}{\kappa}\epsilon_{\alpha\beta\mu}, \quad \mathrm{Tr}\left[P_{\nu}P_{\mu}\right] = 0, \quad \mathrm{Tr}\left[J_{\alpha\beta}J_{\mu\nu}\right] = 0$$

Recover of dimensionless coupling constant

- For $\mathfrak{iso}(2,1)$:

$$\mathrm{Tr}\left[J_{\alpha\beta}P_{\mu}\right] = \frac{\lambda}{\kappa}\epsilon_{\alpha\beta\mu}, \quad \mathrm{Tr}\left[P_{\nu}P_{\mu}\right] = 0, \quad \mathrm{Tr}\left[J_{\alpha\beta}J_{\mu\nu}\right] = 0$$

- Dressing the fields with the algebra,

$$S_{\mathrm{EH}} = \frac{1}{\lambda}\int_{M} \mathrm{Tr}\left[\mathbf{R}\wedge\mathbf{e}\right], \quad \mathbf{R} = \frac{1}{2}\mathbf{R}^{\alpha\beta}J_{\alpha\beta}, \;\; \mathbf{e} = \mathbf{e}^{\mu}P_{\mu}$$

Recover of dimensionless coupling constant

- For $\mathfrak{iso}(2,1)$:

$$\operatorname{Tr}\left[J_{\alpha\beta}P_{\mu}\right] = \frac{\lambda}{\kappa}\epsilon_{\alpha\beta\mu}, \quad \operatorname{Tr}\left[P_{\nu}P_{\mu}\right] = 0, \quad \operatorname{Tr}\left[J_{\alpha\beta}J_{\mu\nu}\right] = 0$$

- Dressing the fields with the algebra,

$$S_{\mathrm{EH}} = \frac{1}{\lambda}\int_{M}\operatorname{Tr}\left[\mathbf{R}\wedge\mathbf{e}\right], \quad \mathbf{R} = \frac{1}{2}\mathbf{R}^{\alpha\beta}J_{\alpha\beta}, \ \ \mathbf{e} = \mathbf{e}^{\mu}P_{\mu}$$

Not standard YM form...

Chern-Simons

- d.o.f. mismatch: 0 v.s. $2N_c$

Chern-Simons

- d.o.f. mismatch: 0 v.s. $2N_c$
- Available gauge theory with 0 d.o.f.: Chern-Simons!

$$S_{\mathrm{CS}} = \frac{1}{2\lambda} \int_M \mathrm{Tr} \left[\mathbf{A} \wedge \left(\mathbf{dA} + \frac{1}{3} [\mathbf{A} \overset{\wedge}{,} \mathbf{A}] \right) \right]$$

Chern-Simons

- d.o.f. mismatch: 0 v.s. $2N_c$
- Available gauge theory with 0 d.o.f.: Chern-Simons!

$$S_{\mathrm{CS}} = \frac{1}{2\lambda}\int_M \mathrm{Tr}\left[\mathbf{A}\wedge\left(\mathbf{dA}+\frac{1}{3}[\mathbf{A}\overset{\wedge}{,}\mathbf{A}]\right)\right]$$

- Tentative: CS theory of ISO(2,1), $\mathbf{A}=\boldsymbol{\omega}+\mathbf{e}$,

Chern-Simons

- d.o.f. mismatch: 0 v.s. $2N_c$
- Available gauge theory with 0 d.o.f.: Chern-Simons!

$$S_{\mathrm{CS}} = \frac{1}{2\lambda}\int_M \mathrm{Tr}\left[\mathbf{A}\wedge\left(\mathbf{dA}+\frac{1}{3}[\mathbf{A}\overset{\wedge}{,}\mathbf{A}]\right)\right]$$

- Tentative: CS theory of ISO(2,1), $\mathbf{A}=\boldsymbol{\omega}+\mathbf{e}$,

$$S_{\mathrm{CS}} = \frac{1}{\lambda}\int_M \left\langle \mathbf{e}\overset{\wedge}{,}\left(\mathbf{d}\boldsymbol{\omega}+\frac{1}{2}[\boldsymbol{\omega}\overset{\wedge}{,}\boldsymbol{\omega}]\right)\right\rangle = S_{\mathrm{EH}}$$

Match!

Conclusions

- $2+1$ dimensional gravity is a CS gauge theory of ISO(2,1).

Conclusions

- $2 + 1$ dimensional gravity is a CS gauge theory of ISO(2,1).
- Opens path to quantization via well known CS methods.

Conclusions

- $2+1$ dimensional gravity is a CS gauge theory of ISO(2,1).
- Opens path to quantization via well known CS methods.
- Inclusion of cosmological constant change gauge group,

$$\begin{cases} \Lambda > 0 : & SO(3,1),\ (\mathrm{dS}) \\ \Lambda < 0 : & SO(2,2),\ (\mathrm{AdS}) \end{cases}$$

Conclusions

- $2 + 1$ dimensional gravity is a CS gauge theory of ISO(2,1).
- Opens path to quantization via well known CS methods.
- Inclusion of cosmological constant change gauge group,
$$\begin{cases} \Lambda > 0 : & SO(3,1), \ (\text{dS}) \\ \Lambda < 0 : & SO(2,2), \ (\text{AdS}) \end{cases}$$
- Offers a bridge between GR and usual gauge theory intuition.

Conclusions

- $2+1$ dimensional gravity is a CS gauge theory of ISO(2,1).
- Opens path to quantization via well known CS methods.
- Inclusion of cosmological constant change gauge group,

$$\begin{cases} \Lambda > 0: & SO(3,1), \ (dS) \\ \Lambda < 0: & SO(2,2), \ (AdS) \end{cases}$$

- Offers a bridge between GR and usual gauge theory intuition.
- Pose some suggestions about $D = 3+1$.

 Conclusions

Thank You!
